

News Announcement

Ericoid Mycorrhizal Fungi Now Available

We have ERICOID Mycorrhiza now available. Ericoid associates with:

Azalea
Blueberry

Camellia
Cranberry

Heather
Rhododendron

The application is similar to endo and ecto in that the inoculum must be in physical contact with the roots in order to colonize. This is accomplished with small plant by mixing into propagation media or using as a gel root dip.

At this time the product is formulated as a root dip. As experience with this new product is gathered from customers more formulations are likely to be available during 2005 and 2006.

Rate Of Application

Mix 1 lb. with 5 gallons of water. Let stand for 15-30 minutes to form a gel. Dip roots into gel and plant as usual. If gel thickens add water to get good sticking to roots. Contents will treat 500 seedlings.

Cost

Cost of product \$49.95 per lb., or 10 cents per plant.
