In This Issue: **Spray-Dried Yucca - SOLUBLE!!**

### **Company Secures New Alliance**

We are happy to announce the introduction of DIEHARD™ Yucca SDS, a completely soluble yucca that is processed by a unique spray dried process, which results in a completely soluble product for the “Green Industry”.

Yucca has recently been introduced to the turf and arbor markets in the United States although the product has been used agriculturally for many decades as a soil amendment, foliar spray, wetting agent, stress relief agent, and growth promoter.

The component of Yucca schidigera that enables it to be used in such diversified industries is steroid saponins. They are the active ingredients that have proven to be functional in a myriad of different applications.

One of the biggest problems with the use of yucca to date has been its lack of complete solubility. Spray drying liquid yucca has cured this problem. Our DIEHARD™ Yucca SDS is a COMPLETELY SOLUBLE product. Plus, the new manufacturing process has improved significantly the actual amount of active components from an average of below 40%, to 50%, an increase in potency of 25%.

We are very pleased to offer this new form of an organic product to the market and trust our customers and clients will appreciate this new easy-to-use, non-clogging formulation.
